

The 9 assumptions for evolution:-

- 1/** The processes of nature that we see today have always been going on at the same rate.
- 2/** Very long periods of time were necessary to account for the slow-acting processes.
- 3/** Rock layers build up very slowly by deposits of sediment mostly under water.

- 4/ The continents have risen and fallen to account for the multiple layers of sediment.
- 5/ The geologic column was formed on uniformitarian principles.
- 6/ The ascending fossil record is perfect.
- 7/ The relatively small variation within a species did, over a long time, become major variations, forming new species.

8/ All life is related.

9/ Life has progressed from the simple to the complex.
